

Peaktify Product & Adoption Manager

Candidate Case Exercise

Thank you for moving forward in the process. This exercise is designed to assess how you understand Peaktify, how you think through early-stage product and adoption challenges, and how you turn messy field reality into structured product action.

Role	Product & Adoption Manager
Format	Submit in writing first, then be ready to present live if shortlisted
Suggested timebox	3–6 hours maximum
Submission format	Document, slides, Notion page, or equivalent written format

What matters most

- Clarity, judgment, and structure matter more than polish for the sake of polish.
- We are not looking for a perfect answer. We are looking for how you think.
- Choose the format that helps you communicate your reasoning most clearly.

1. Before you start

- Review the Peaktify [website](#) and [interactive demo](#).
- Use the exercise to show how you think, not just what you know.
- Where you make assumptions, state them clearly instead of hiding uncertainty.

2. Scenario

Peaktify is working with a design partner in an early adoption phase. The partner is using Peaktify primarily in a discovery and analysis motion to help structure delivery work and generate implementation-grade outputs. The team has started using project and work-cycle records, workshops, captured artifacts, BRD generation, and the work-cycle agent. Some users are also interacting with the Command Center and P for summaries and safe actions.

Peaktify is designed to be workflow-native, human-led, and governed through approvals, auditability, and explicit handling of uncertainty through Open Items and Out-of-Scope Items.

Feedback and observations

- Several users say the platform looks promising, but they are not always sure where to start. Some begin in the Command Center, others go directly into projects or work cycles, and newer users are unclear which path is best for which task. One delivery lead said: “The value becomes clearer after a while, but the first 15 minutes are not obvious enough.”
- Workshop Prep Pack is appreciated by some users, especially the agenda and question bank. Others say they still need more guidance on how to use it well in practice. A few workshops were captured, but follow-up discipline after the session was inconsistent. In some cases, draft MoM outputs were reviewed late, so users lost confidence in the speed-to-value.
- The design partner likes the idea of capturing emails, meeting outputs, and files into structured workspaces. In reality, some artifacts are ending up unassigned or routed late. A few important items sat in Inbox too long before being triaged. One reviewer said: “If the inputs are not routed cleanly, the outputs stop feeling trustworthy.”
- Users like that Peaktify can generate a structured BRD with sections, tables, use cases, and diagrams. However, some users are confused about whether a document is still a draft, ready for internal review, or final enough for external sharing. In one case, a BRD was exported while several Open Items were still unresolved.

- One stakeholder wants richer cross-project analytics and dashboard-style visibility from the Command Center as soon as possible. Another says dashboards can wait and the real priority is making the existing discovery workflow easier to adopt and trust. A third wants more aggressive automation, including auto-sending MoM and pushing outputs faster. A fourth is uncomfortable with that and insists human approval must remain explicit for anything externally shared.
- The COO wants the team to prioritize changes that improve adoption fastest without creating shallow fixes that will need to be undone later. The CTO wants fewer vague requests and clearer product requirements before engineering takes on new work. Engineering has already pushed back on a few recent items because problem framing was too loose or solution assumptions were premature.
- The work-cycle agent is seen as useful, but not all users fully understand when to rely on it versus when to use P in the Command Center. Private Vault exists, but is not yet being used consistently enough to strengthen output grounding. Some users asked for capabilities that are directionally aligned with the roadmap, but not all of them should be prioritized now.
- This is a design-partner environment, not a fully mature commercial deployment. The goal is not to say yes to every request. The goal is to improve adoption, learn from real usage, strengthen the product, and make good decisions under real constraints.

3. Your task

Part 1 — In your own words: what is Peaktify?

- What is Peaktify?
- What problem is it solving?
- What do you believe is the most important current use case or value proposition?
- What do you believe Peaktify should be especially careful not to become at this stage?

Part 2 — Diagnose the situation

- What do you think are the real underlying problems, not just the visible requests?
- Which issues are primarily adoption/onboarding problems, workflow/process problems, product/UX problems, or requirement-quality/internal operating problems?
- Which feedback would you treat as high-signal versus low-signal at this stage, and why?

Part 3 — Prioritization and decision-making

- What would you prioritize first, second, and third?
- Why?
- What would you deliberately not prioritize yet, even if someone asked for it?
- How would you balance quick adoption wins, output trust and confidence, engineering clarity, and scalable product decisions?

Part 4 — Backlog proposal

- Create 6–8 proposed backlog items.
- For each item, include: title, problem it solves, user/stakeholder affected, why it matters now, suggested priority, and whether it is mainly adoption enablement, product improvement, workflow/process improvement, bug/quality/reliability, or future roadmap candidate.

Part 5 — Write one sample PRD / structured requirement

- Choose the single most important item from your backlog and write a concise but high-quality PRD or structured requirement.
- Include: problem statement, user context, desired outcome, scope, out of scope, proposed approach, acceptance criteria, dependencies/assumptions, and open questions/risks.

Part 6 — Adoption and field execution plan

- Imagine you joined Peaktify and were responsible for helping this design partner succeed over the next 30 days.
- Outline how you would improve adoption and confidence, collect and structure feedback, work with the COO on prioritization, work with the CTO/engineering on requirement quality, and what success signals you would track.

Part 7 — Questions, assumptions, and trade-offs

- List the top questions you would want answered before finalizing recommendations.
- State the assumptions you made.
- Highlight the most important trade-offs you see in this scenario.

4. Evaluation lens

- How clearly you understand Peaktify and its current value
- How well you separate signal from noise
- How you prioritize under real constraints
- How usable your backlog and requirement writing are
- How you connect customer reality to product execution
- How you handle ambiguity without becoming vague
